

# Introduction to MATLAB®

for

Numerical Analysis and Mathematical Modeling

Selis Önel, PhD

# Advantages over other programs

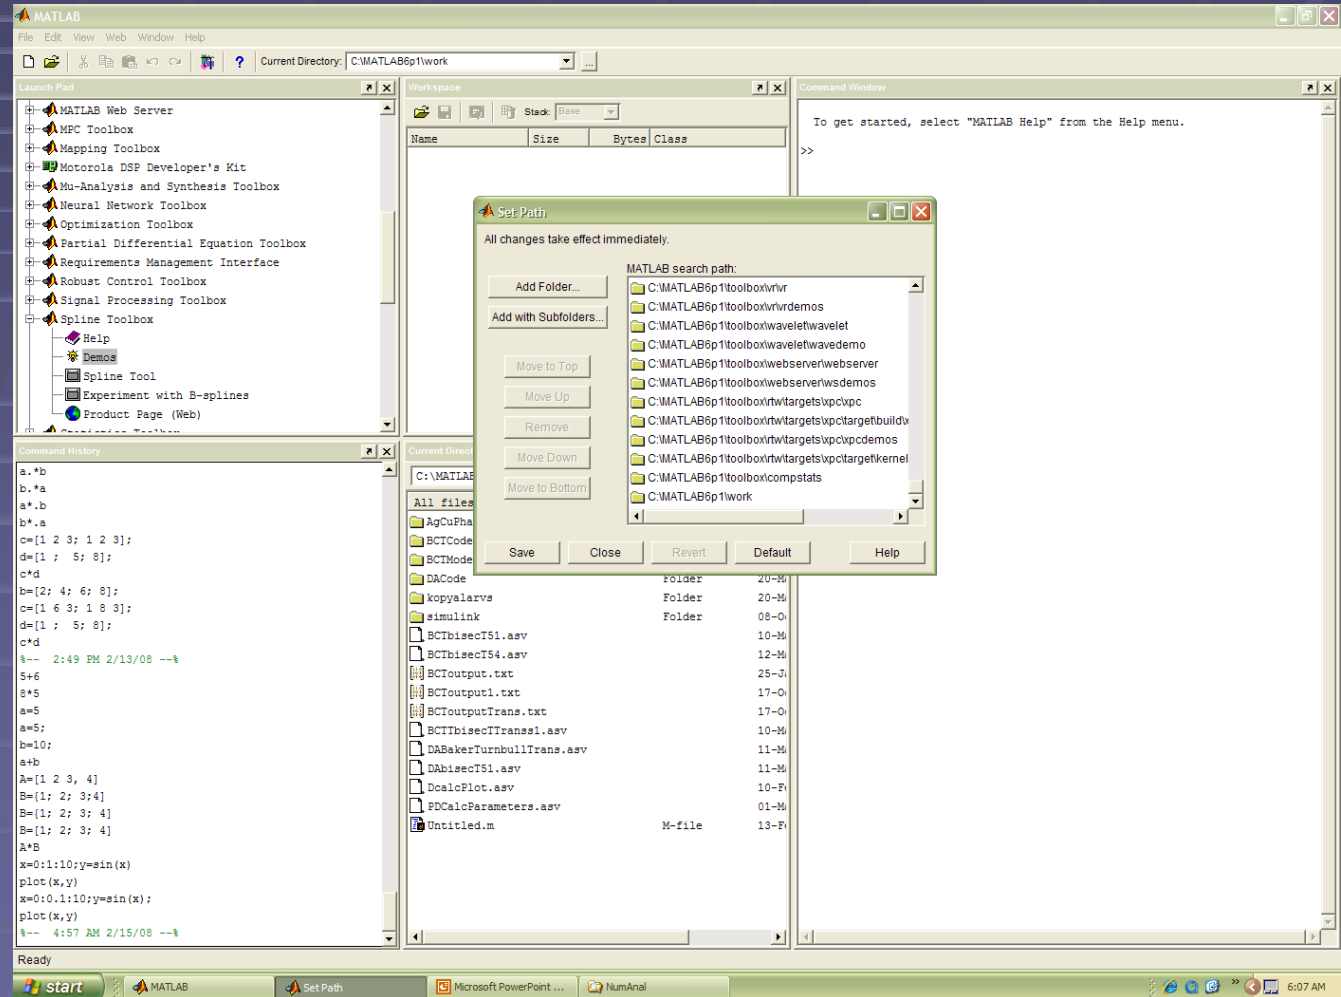

- Contains **large number of functions** that access numerical libraries (LINPACK, EISPACK)  
ex: solves simultaneous eqn. with a single function call
- Has strong **graphics support**  
ex: Plots results of computations with a few statements
- Treats all numerical objects as **double-precision arrays**  
ex: Does not require declaration/conversion of data types

Reference: J. Kiusalaas, Numerical Methods in Engineering with MATLAB®, Cambridge University Press, New York, NY, 2005

# Set the Path for the Folder First

Where will you keep your MATLAB® files?

- Click File and click Set Path
- Add the folder you want to use to the top of the list
- Save and Close the window
- Set the Current Directory to the same folder

# Using the Command Window

The command window is *interactive*

Each command is executed upon its entry  
*i.e.* just like an electronic calculator

>> MATLAB®'s prompt for input

% (percent) Marks the beginning of a comment

;(semicolon)

- Suppresses printout of intermediate input and results
- Separates the rows of a matrix

, (comma) Separates variables

# Creating an Array

```
>> M = [1 2 3
```

```
4 5 6
```

```
7 8 9]
```

```
M =
```

```
1 2 3
```

```
4 5 6
```

```
7 8 9
```

```
>> % or create it using semicolons to make new  
rows
```

```
>> M = [1 2 3; 4 5 6; 7 8 9]
```

```
M =
```

```
1 2 3
```

```
4 5 6
```

```
7 8 9
```

# Matrix and Vector Operations

```
>> %Create a 3x3 matrix
>>A = [1 5 3; -2 4 -3; 6 7 8]; % Input 3x3 matrix
>> B = [4; 9; 0]; % Input column vector
>> A
A =
    1    5    3
   -2    4   -3
    6    7    8
>> B
B =
    4
    9
    0
>> C = A\B % Solve A*C=B by left division
C =
  -0.5775
   1.3803
  -0.7746
```

# Elements of an Array

```
>> A11=1; A12=12; A21=21; A22=22;
```

```
>> A=[A11 A12; A21 A22];
```

```
>> A
```

```
A =
```

```
    1    12
```

```
    21    22
```

```
>> % Section of this array can be extracted by use of colon notation
```

```
>> A(1,2) % Element in row 1, column 2
```

```
ans =
```

```
    12
```

```
>> A(:,2) % Elements in the second column
```

```
ans =
```

```
    12
```

```
    22
```

```
>> A(1,:) % Elements in the first row
```

```
ans =
```

```
    1    12
```

# Arithmetics

```
>> A=[ 1 0 3; 2 4 6]; B=[20 30 40; -1 3 5];
```

```
>> C=A.*B % Element-wise multiplication
```

```
C =  
    20     0   120  
    -2    12    30
```

```
>> C=A*B % Matrix multiplication fails
```

```
??? Error using ==> * % due to incompatible dimensions  
Inner matrix dimensions must agree.
```

```
>> C=A*B' % Matrix multiplication
```

```
C =  
   140    14  
   400    40
```

# Arithmetic operators

+	Addition
-	Subtraction
*	Multiplication
^	Power
'	Transpose
\	Left division
/	Right division

In MATLAB®,

- if matrix sizes are incompatible for the matrix operation, an error message will result, except for scalar-matrix operations (for addition, subtraction, and **division** as well as for multiplication)
- In scalar-matrix operations each entry of the matrix is operated on by the scalar. The "matrix **division**" operations have special cases.

## Array operations:

- Addition and subtraction operate **entry-wise** but others do not
  - \*, ^, \, and /, can operate **entry-wise** if preceded a period
- ex: Both  $[1,2,3,4].*[1,2,3,4]$  or  $[1,2,3,4].^2$  yield  $[1,4,9,16]$

# Matrix Division

If  $A$  is an invertible square matrix and

- If  $b$  is a compatible **column vector**, then  $x = A \setminus b$  is the solution of  $A * x = b$  and
- If  $B$  is a compatible **row vector**, then  $x = B / A$  is the solution of  $x * A = B$ .

In **left division**,

- if  $A$  is square, then it is factored using Gaussian elimination. The factors are used to solve  $A * x = b$
- If  $A$  is not square, it is factored using Householder orthogonalization with column pivoting and the factors are used to solve the under- or over-determined system in the least squares sense

**Right division** is defined in terms of **left division** by

$$b / A = (A' \setminus b)'$$

# Matrix Division

**Division is not a standard matrix operation !**

To remember the notation for the operators: **Backslash \** and **Slash /**

**Backslash \** solves systems of linear equations of the form  $Ax=b$

**Slash /** solves systems of linear equations of the form  $xA=b$

If  $A$  is an invertible square matrix and if  $b$  is a compatible vector:

Left multiplication by  $A^{-1}$  gives  $A^{-1}Ax = A^{-1}b \rightarrow x = A^{-1}b \rightarrow x=A \backslash b$

Right multiplication by  $A^{-1}$  gives  $xA A^{-1} = bA^{-1} \rightarrow x = bA^{-1} \rightarrow x=b/A$

Note:  $\backslash$  and  $/$  apply to nonsquare and singular systems where the inverse of the coefficient matrix does not exist.

# Matrix Building Functions

A is a square  
matrix

n is an  
integer

eye(n)	Identity matrix
zeros(n)	Matrix of zeros
ones(n)	Matrix of ones
diag(A)	Diagonal matrix
triu(A)	Upper triangular part of a matrix
tril(A)	Lower triangular part of a matrix
rand(n)	Randomly generated matrix
hilb(n)	Hilbert matrix
Magic(n)	Magic square

# Built-in Constants and Special Variables

%The smallest difference between two numbers

```
>> eps = 2.2204e-016
```

```
>> pi = 3.1416
```

%Limits of floating numbers shown as  $a \cdot 10^b$  where  $0 \leq a < 10$  and  $-308 \leq b \leq 308$

```
>> realmin = 2.2251e-308
```

```
>> realmax = 1.7977e+308
```

```
>> i = 0 + 1.0000i
```

```
>> j = 0 + 1.0000i
```

%Undefined numbers (Not a number like 0/0)

```
>> NaN = NaN
```

```
>> inf = Inf
```

%Overflow when limit is exceeded:

```
>> (2.5e100)^2 = 6.2500e+200
```

```
>> (2.5e200)^2 = Inf
```

# Attention to some calculations

%1-0.4-0.2-0.4 should be equal to 0, BUT in MATLAB®:

```
>> 1-0.4-0.2-0.4 = -5.5511e-017
```

Reason:

In binary computer representation 0.2 has continuous digits after the decimal point

$$(0.2)_{10} = (0.0011001100110011\dots)_2$$

So the result will never be equal to 0

# Format function

Affects only how numbers are displayed, not how MATLAB computes or saves them

Type	Result	Example
short	Scaled fixed point format, with 5 digits	3.1416
long	Scaled fixed point format, with 15 digits for double; 7 digits for single	3.14159265358979
short e	Floating point format, with 5 digits	3.1416e+000
long e	Floating point format, with 15 digits for double; 7 digits for single	3.141592653589793e+000
short g	Best of fixed or floating point, with 5 digits	3.1416
long g	Best of fixed or floating point, with 15 digits for double; 7 digits for single	3.14159265358979
short eng	Engineering format that has exactly 6 significant digits and a power that is a multiple of three	3.1416e+000
long eng	Engineering format that has exactly 16 significant digits and a power that is a multiple of three	3.14159265358979e+000

# Special Commands

- **Clear** removes all variables from the workspace
- **Clc** clears the command window and homes the cursor
- **Clf** deletes all children of the current figure with visible handles
- **More** Control paged output in command window:
  - **More on / More off** enables/disables paging of the output in the MATLAB command window
  - **More(n)** specifies the size of the page to be n lines
- **Who** lists the variables in the current workspace
- **Whos** lists more information about the variables and the function to which each variable belongs in the current workspace
- **Who -file filename** lists the variables in the specified .mat file
- **Date** returns current date as date string  
S = Date returns a string containing the date in dd-mmm-yyyy format
- **Clock** = [year month day hour minute seconds]

# Simple Mathematical Functions

- **abs(x)** : Absolute value of x  
Ex:  $\text{abs}(-20.0560) = 20.0560$
- **sign(x)** : Signum function  
For each element of x, it returns 1 if the element is greater than zero, 0 if it equals zero and -1 if it is less than zero. For the nonzero elements of complex x,  $\text{sign}(x) = x./\text{abs}(x)$   
Ex:  $\text{sign}(-20.0560) = -1$
- **fix(x)** : rounds the elements of x to the nearest integers towards zero  
Ex:  $\text{fix}(20.0560) = 20$
- **round(x)** : rounds the elements of x to the nearest integers  
Ex:  $\text{round}(20.0560) = 20$
- **rem(x,y)** : remainder after division  
 $\text{rem}(x,y)$  is  $x - n.*y$  where  $n = \text{fix}(x./y)$  if  $y \neq 0$ . If y is not an integer and the quotient  $x./y$  is within roundoff error of an integer, then n is that integer  
The inputs x and y must be real arrays of the same size, or real scalars  
Ex:  $\text{rem}(20.056,5) = 0.0560$

# Simple Mathematical Functions

- **exp(x)** : Exponential of the elements of x, e to the x  
For complex  $z=x+i*y$ ,  $\exp(z) = \exp(x)*(\cos(y)+i*\sin(y))$   
Ex:  $\exp(100) = 2.6881e+043$ ,  $\exp(-100) = 3.7201e-044$   
 $\exp(100+i*100) = 2.3180e+043 -1.3612e+043i$
- **log(x)** : natural logarithm of the elements of x.  
Ex:  $\log(100) = 4.6052$ ,  $\log(-100) = 4.6052 + 3.1416i$
- **log10(x)** : Common base 10 logarithm of the elements of x  
Ex:  $\log_{10}(100) = 2$ ,  $\log_{10}(-100) = 2.0000 + 1.3644i$
- **sqrt(x)** : square root of the elements of x  
Ex:  $\sqrt{100} = 10$ ,  $\sqrt{-100} = 0 + 10.0000i$

Complex results are produced if x is not positive in log(x), log10(x), sqrt(x)

# Working with m-files

# Working with m-Files: Functions

Write this in a new m-file and save it as ExConditionalsFunc, i.e., the exact name of the function, and run it

```
%This exercise uses
%if, else, elseif conditionals
% in a function you create
function d=ExConditionalsFunc(a,b,c)
d=a*b;
if d<c
    d=d;
elseif d==c
    d=c;
else
    d=0;
end
d
```

Use the Command Window (or a new m-file) to assign values to *a*, *b*, *c* and call the function to calculate *d*

```
>> a=1; b=3; c=8;
>> ExConditionalsFunc(a,b,c)
d =
    3
```

# Finding Roots Using Built-in Functions

## 'roots' and 'fzero'

```
% x = fzero(f,x0)
% tries to find a zero of f near x0
% Write an anonymous function f:
f = @(x)x.^4-3*x-4;
% Then find the zero near x0=-2:
x0=-2;
z = fzero(f,x0)
% To find all the roots of a polynomial f
% use roots([c1 c2 c3 ...])
f_root=roots([1 0 0 -3 -4])
```

When you run this script in an m-file, here is what you will see in the Command Window

```
z =
    -1

f_root =
    1.7430
   -0.3715 + 1.4687i
   -0.3715 - 1.4687i
   -1.0000
```

# MATLAB variables are ...

## Case sensitive

- **MyNumber** and **mynumber** represent different variables
- Length of the name is unlimited, but the first  $N$  characters are significant
- To find  $N$  for the MATLAB installed on your computer type: **namelengthmax**
- Applies to: Variable names, Function and subfunction names, Structure fieldnames, Object names, M-file names, MEX-file names, MDL-file names

# Displaying numbers and values on the command window

- Omit the `;` at the end of the line

```
>> cost=500;
```

```
>> cost=500
```

```
cost = 500
```

- Use the **disp** command

```
>> disp(cost), disp('dollars')
```

```
500
```

```
dollars
```

```
>> disp([num2str(cost), ' dollars'])
```

```
1000 dollars
```

- Use the **fprintf** command

```
>> fprintf('1. cost = %3.2f \n2. cost = %3.2e \n3. cost = %3.2g \n ', cost,  
cost, cost)
```

```
1. cost = 500.00
```

```
2. cost = 5.00e+002
```

```
3. cost = 5e+002
```

# Command fprintf

```
x = 0:.5:5; y = [x; exp(x)];  
fid = fopen('fprintfex.txt','wt');  
fprintf(fid,'%6.2f %12.8f\n',y);  
fclose(fid);
```

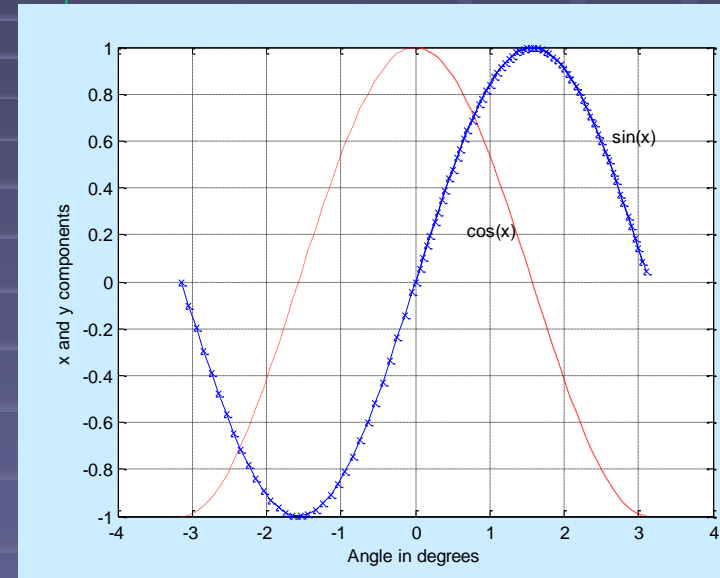

% Now examine the contents of  
fprintfex.txt:

```
>> type fprintfex.txt  
0.00 1.00000000  
0.50 1.64872127  
1.00 2.71828183  
1.50 4.48168907  
2.00 7.38905610  
2.50 12.18249396  
3.00 20.08553692  
3.50 33.11545196

```

# Plotting in MATLAB®

Write and run the following script in an m-file or in the command window

```
% This program draws a graph of sin(x) and cos(x)
% where 0 <= x <= 3.14
ang=-pi:0.1:pi;      % Create array
xcomp=cos(ang);      % Create array
plot(ang,xcomp,'r:'); % Plot using dots(:) with red (r)
hold on              % Add another plot
                    % on the same graph
ycomp=sin(ang);      % Create array
plot(ang,ycomp,'b-x'); % Plot using lines(-)
                    % and the symbol x at each
                    % data point with blue (b)
grid on              % Display coordinate grids
xlabel('Angle in degrees'); %Display label for x-axis
ylabel('x and y components'); %Display label for y-axis
gtext('cos(ang)');   % Display mouse-movable text
gtext('sin(ang)');   % Display mouse-movable text
```

# Plotting

```
% This program draws multiple graphs
a=0.652;           % Assign constant parameter a
x=10:-0.5:0.5;    % Create x-array
y=exp(x);         % Create y-array
z=log(2*x);       % Create z-array
zz=a*x.^2;       % Create zz-array
figure(1)         % Create a figure
semilogy(x,y,'k-.',x,z,'g-*');
                    % Use logarithmic plot on y axis
xlabel('x');       % Display label for x-axis
ylabel('y and z'); % Display label for y-axis
title('Figure 1'); % Insert title for figure
figure(2)         % Create new figure
plot(x,zz,'-');   % Plot using lines(-)
xlabel('x');       % Display label for x-axis
ylabel('zz');      % Display label for y-axis
